附註

依據本院2009年淋巴瘤年報，罹患瀰漫性大B型淋巴瘤及濾泡型淋巴瘤病患，使用標靶治療Rituximab併用化療CEOP較單用化療處方CEOP顯著增加整體存活率（p值為0.0001）。此統計結論與西方國家的研究報告相同，因此2010年7月本院淋巴瘤治療指引修正為：瀰漫性大B型淋巴瘤及濾泡型淋巴瘤使用Rituximab併用化療CEOP處方，台灣病患治療成績證實與西方國家同樣優秀，因而在療效更好的處方問世前，淋巴瘤團隊建議持續使用Rituximab併用化療處方CEOP。

附註

隨著老年人口的增加，有半數以上診斷DLBCL的病人年紀超過65歲，而這些老年人通常併有其它疾病，故會影響其接受標準劑量(R-CHOP)治療的原因之一。但不應該只以年紀來當成不可治療或調降藥物劑量之因素。因研究顯示DLBCL經治療後不論年輕或老年人皆可改善整體存活率，故應由臨床醫師評估病人整體狀況，包括病人容忍度來調整藥物劑量如(mini-R-CHOP、R-COP…等)，以達治療效果並儘可能減少毒性發生，降低併發症的產生。

Hodgkin Lymphoma

Kaohsiung Veterans General Hospital
Clinical Practice Guideline 2018 Version 1.0

Table 1

Definitions of Stages in Hodgkin's Disease

Stage I Involvement of a single lymph node region (I) or localized involvement of a single extralymphatic organ or site (I_E).

Stage II Involvement of two or more lymph node regions on the same side of the diaphragm (II) or localized involvement of a single associated extralymphatic organ or site and its regional lymph node(s), with or without involvement of other lymph node regions on the same side of the diaphragm (II_E).

Note: The number of lymph node regions involved may be indicated by a subscript (eg, II_2).

Stage III Involvement of lymph node regions on both sides of the diaphragm (III), which may also be accompanied by localized involvement of an associated extralymphatic organ or site (III_E), by involvement of the spleen (III_S), or by both (III_{E+S}).

Stage IV Disseminated (multifocal) involvement of one or more extralymphatic organs, with or without associated lymph node involvement, or isolated extralymphatic organ involvement with distant (nonregional) nodal involvement.

A No systemic symptoms present

B Unexplained fevers $>38^\circ\text{C}$; drenching night sweats; or weight loss $>10\%$ of body weight (within 6 months prior to diagnosis)

Follicular lymphoma

Kaohsiung Veterans General Hospital
Clinical Practice Guideline 2018 Version 1.0

Diagnosis Essential :

- * Hematopathology review of all slides with at least one paraffin block representative of tumor. Rebiopsy if consult material is nondiagnostic.
- * An FNA or core needle biopsy alone is not generally suitable for the initial diagnosis of lymphoma. In certain circumstances, when a lymph node is not easily accessible for excisional or incisional biopsy, a combination of core biopsy or FNA biopsies in conjunction with appropriate ancillary techniques for the differential diagnosis may be sufficient for diagnosis.
- * IHC panel : CD20, CD3 (as described by the pathologist)
- Useful under certain circumstances :
 - * IHC panel : CD30, CD5, CD10, CD45, BCL2, BCL6, Ki-67, IRF4/MUM1 or
 - * Cell surface marker analysis by flow cytometry : kappa/lambda, CD45, CD3, CD5, CD19, CD10, CD20
 - * Additional immunohistochemical studies to establish lymphoma subtype
 - * IHC panel : Cyclin D1, kappa/lambda, CD30, CD138, EBER-ISH, ALK, HHV8
 - * Molecular analysis to detect : antigen receptor gene rearrangements ; CCND1 ; BCL2 ; BCL6 ; MYC Rearrangements by either FISH or IHC
 - * Cytogenetics or FISH : t (14 ; 18), t (3 ; v), t (8 ; 14)

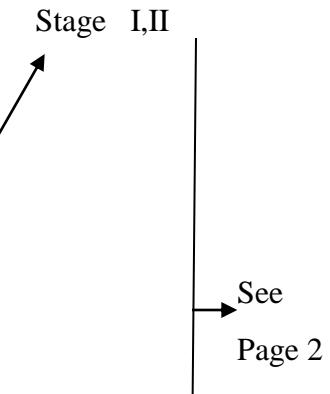

Work-up Essential :

- * Physical exam : attention to node-bearing areas, including Waldeyer's rings, and to size of liver and spleen
- * Performance status
- * B-symptoms
- * CBC & differential, LDH, Uric acid
- * Comprehensive metabolic panel
 - ◆ CT : face / chest / abdominal / pelvic or PET
 - ◆ bone marrow biopsy ± aspirate
- * IPI SCORE
- * Hepatitis B、C testing
- * Echo cardiogram or ejection fraction

選擇性：

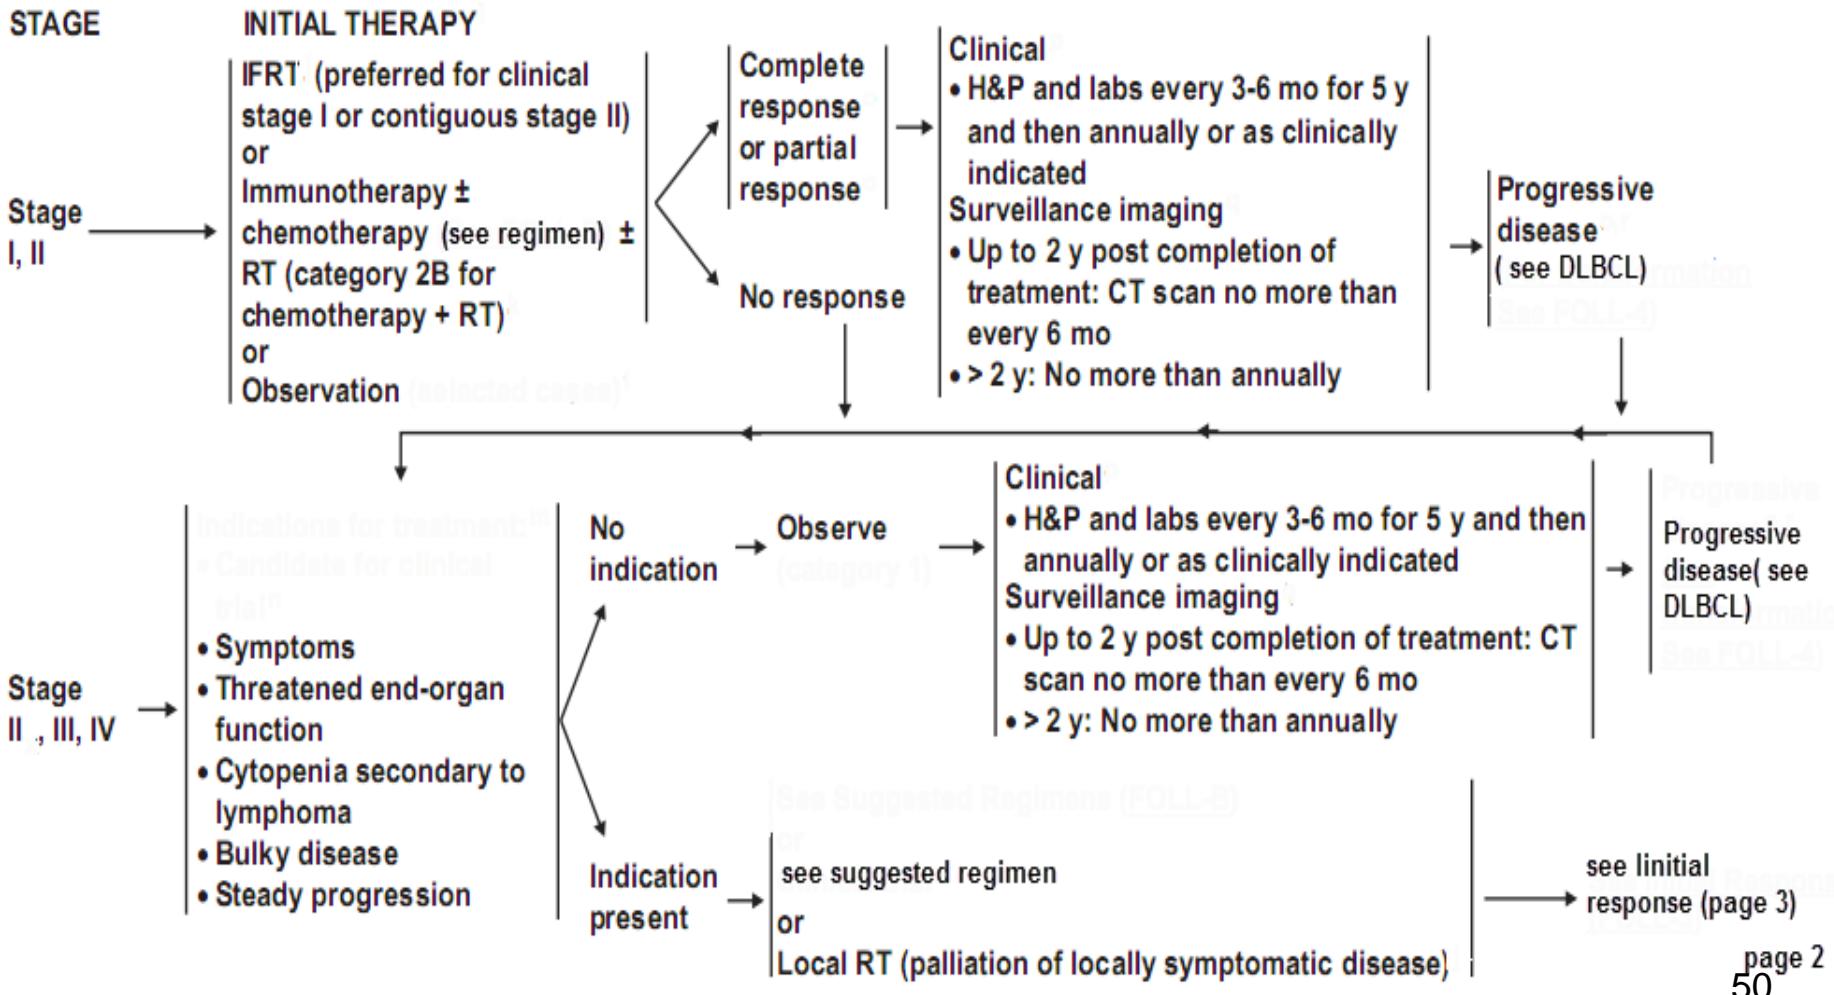

- * HIV
- * Discussion of fertility issues and sperm banking
- * Lumbar puncture
- * Beta2-microglobulin
